

Product Specification Summary

PCR Amplification & Analysis

Catalog Number	40-3032-10
Product Name	Betaine 5M; 1 mL
Size	1 mL
Storage	Store at -20°C

PCR additives Betaine, DMSO and formamide reduces the T_m and the complex secondary structure thus the duplex stability. Tetramethyl ammonium chloride (TMAC) actually increases the specificity of hybridization and increases the T_m . The use of TMAC is recommended in PCR conditions using degenerate primers. These PCR additives and enhancing agents have been used to increase the yield, specificity and consistency of PCR reactions. These additives may have beneficial effects on some amplification and it is impossible to predict which agents will be useful in a particular context and therefore they must be empirically tested for each combination of template and primers. Betaine reduces T_m facilitating GC rich region amplification. Reduces duplex stability. Use 3.5M to 0.1M betaine. Be sure to use Betaine or Betaine (mono)hydrate and not Betaine HCl.
