

# Product Specification Summary

## PCR Amplification & Analysis

Catalog Number	40-3053-10
Product Name	TMAC (Tetramethyl ammonium chloride) 100 mM; 1 mL
Size	1 mL
Description	PCR Additive
Component/Note	Chloride
Component/Note	Tetramethyl ammonium-

PCR additives Betaine, DMSO and formamide reduces the  $T_m$  and the complex secondary structure thus the duplex stability. Tetramethyl ammonium chloride (TMAC) increases the specificity of hybridization and increases the  $T_m$ . The use of TMAC is recommended in PCR conditions using degenerate primers.

These PCR additives and enhancing agents have been used to increase the yield, specificity and consistency of PCR reactions. These additives may have beneficial effects on some amplification and it is impossible to predict which agents will be useful in a particular context and therefore they must be empirically tested for each combination of template and primers. TMAC is used to reduce potential DNARNA mismatch and improve the stringency of hybridization reactions. It increases  $T_m$  and minimizes mis-pairing. TMAC is generally used at a final concentration of 15-100mM to eliminate nonspecific priming.
