Oligo Modifications

For research use only. Not for use in diagnostic procedures for clinical purposes.

Alkyne-C3

Category	Click Chemistry
Modification Code	Alk-C3
Reference Catalog Number	26-6739
5 Prime	N
3 Prime	Y
Internal	N
Molecular Weight(mw)	273.1

Alkyne C3 (for 3')

[26-6739-XX]

Click here for a complete list of Click Chemistry Oligo Modifications

Alkyne C3 can be used to incorporate an active alkyne at the 3' end of an oligonucleotide. The presence of the alkyne allows the user to use Click Chemistry (a [3+2] cycloaddition reaction between alkynes and azides, using copper (I) iodide as a catalyst) to conjugate it to a variety of azide-containing labels/tags (e.g., fluorescent dyes, biotin, or oligos, with extremely high regioselectivity and efficiency (1,2). When conjugation to an azide-oligo is desired, preparation of the azide-oligo can be achieved using either an Azidobutyrate NHS Ester or the 5'-Bromohexyl modifier (see their respective tech sheets for details). Click chemistry can be used to form short, cyclic oligos that can be used as research tools in various biophysical and biological studies (3). In particular, they have considerable potential for in vivo work, as cyclic oligos are known to be very stable in serum for up to several days.
